

### ABSTRACT OF THE DISCLOSURE

An analyzer system has one or more software programs for performing analysis procedures or analyzing results thereof, job information for adapting the software to perform the analysis procedures, job data for linking the job information to the analyzer software for a given analysis procedure, job launching software for launching the analyzer software to perform an analysis procedure, and job representing software for representing a job on a display. A computer executes the software programs, and the programs contain a user interface that is customized by the job information by setting a type of information to be displayed, a level of detail of information to be displayed, and a number of prompts for requesting a user to input information, and setting how the analyzer software will analyze the information input by the user.
